

INTRODUCING ZERO MEMORY

With this board, AST introduces zero memory -- your way of ensuring you will have the memory configuration you need. No memory chips are included. You have the option of purchasing a memory upgrade kit for your board from your authorized AST reseller or purchasing chips separately. Refer to your user's manual for a list of approved chips.

For information on how to install chips, refer to your user's manual. Line up the notch on the chip with the notch on the socket on the board.
